

Maricopa County Recorder Uses ARPEGGIO Live! for Internet Access of Public Record Images

Starting July 1st our Maricopa County Recorder will be on the Internet providing access to public records (<http://156.42.40.23/public/recorder/imaging/imginfo.html-ssi>). With Wall Data's ARPEGGIO Live! as the primary interface between the web browser and AS/400, anyone can now look up images of public records.

"This move can benefit virtually every citizen in Maricopa County as well as people throughout Arizona and the United States. People conducting investigations, looking up family history, or making any inquiries will be able to access the system in addition to title companies and other businesses," said Helen Purcell, Maricopa County Recorder.

ARPEGGIO™ Live! Information Publishing Server software is a comprehensive solution that allows organizations to instantly publish real-time information and applications over corporate intranets and the Internet to business users with a Web browser. ARPEGGIO Live! runs on any Windows NT server (uses IIS) and includes three modules, called Extensions, that automatically make information from enterprise databases and IBM Mainframe and AS/400 applications available in a browser.
